

Generative AI

Generative AI refers to artificial intelligence systems that can create new content including text, images, audio, and video. Large language models are a prominent example, capable of generating human-like text based on patterns learned during training. Modern generative models like GPT-4, Claude, and Gemini use transformer architectures with billions of parameters. These models can write code, answer questions, summarize text, and engage in natural conversations. Generative AI has applications across industries including content creation, customer service, education, and software development. However, challenges remain around accuracy, bias, and ensuring responsible use.
