

LangChain Basics

LangChain is an open-source framework designed for building applications with large language models. It provides a standardized interface for connecting LLMs to other data sources and computation. Key components include chains for sequencing operations, agents for dynamic tool use, memory for conversation context, and prompts for input formatting. LangChain supports integration with various LLM providers including OpenAI, Anthropic, Hugging Face, and local models. The framework simplifies complex NLP tasks like question answering, summarization, and chatbots.
