

Prompt Engineering

Prompt engineering is the practice of crafting effective inputs to large language models to achieve desired outputs. It involves carefully designing the prompt structure, including instructions, context, and examples. Key techniques include zero-shot prompting without examples, few-shot prompting with examples, chain-of-thought reasoning, and role-playing. Effective prompts specify the desired format, contain relevant context, and clearly state the task. In RAG systems, prompt engineering involves structuring the retrieved context and question together. Good prompts can significantly improve the accuracy and relevance of LLM responses.
